The basic operation of the gas turbine is a Brayton cycle with air as the working fluid. Atmospheric air flows through the compressor that brings it to higher pressure. Energy is then added by spraying fuel into the air and igniting it so the combustion generates a high-temperature flow.

## **Gas turbine - Wikipedia**

Gas Turbine Propulsion. Thrust is the force which moves an aircraft through the air. Thrust is generated by the propulsion system of the aircraft. Different types of engines develop thrust in different ways, although thrust is usually generated through some application of Newton's third law -action-> reaction.

## **Gas Turbine Propulsion - NASA**

The standard in aircraft propulsion is the jet engine, basically consisting on a gas turbine delivering most of its work through a shaft that drives either a few-large-blade propeller or a many-small- blade ducted fan.
