effective to treat pain. Examples of adjuvant medications include gabapentin (an anticonvulsant) and amitriptyline (a tricyclic antidepressant).

### **10.8 Adjuvant Analgesics - Nursing Pharmacology**

An adjuvant analgesic, or coanalgesic, is a medication that is not primarily designed to control pain but can be used for this purpose.

## Read Book Pharmacology Of Adjuvant Drugs

Some examples of adjuvant drugs are antidepressants (which are typically used for mental health conditions) and anticonvulsants (used in the treatment of seizure disorders).

Maximum serum radioactivity occurs at 1 to 2 hours after oral S-azathioprine and decays with a half-life of 5 hours. This is not an estimate of the half-life of azathioprine itself, but is the decay rate for all S-containing metabolites of the drug.
